

Invitation To Market Dialogue About A Strategic Digitalization Partnership

Digitalization is not only a technology development process. It is a way to strengthen project execution, productivity, and competitiveness.

The company is a project-intensive contractor with high operational complexity, large delivery environments, and clear requirements for project management, support functions, and collaboration with clients, partners, and other actors in the value chain.

As part of its new business strategy, the company will establish a digital strategy that supports its ambitions and operational needs. The ambition is to strengthen insight, foresight, data-driven decision support, and the ability to create more value and profitability through technology, data, and effective ways of working.

The company already has an established digital foundation. This includes project management tools, Microsoft 365 as a digital core, internal development, cloud-based solutions, a data warehouse for business insight and data sharing, and other supporting systems.

At the same time, there is a need to assess the system landscape, data flow, work processes, and governance model more holistically. The company also needs to ensure flexibility in technology choices and prioritize which initiatives actually create impact, and how they can be implemented in a demanding contractor environment without piloting itself into the ditch.

For the company, digitalization is not only about technology. It is a tool to strengthen project delivery, productivity, and competitiveness. Artificial intelligence, automation, better use of data, and new forms of collaboration open up concrete improvements in how the company plans, manages, and executes projects. In the office, on site, and in production.

The people in the company create the results, and digitalization should make their everyday work safer and more efficient. As technology develops faster, especially with artificial intelligence, the company needs to turn technology into practical value safely and effectively.

The Company's Digital Starting Point And Future Needs

The company is entering a new phase in its digital development. It is working on a new business strategy for the coming period and will also establish a digital strategy that supports business goals, operational needs, and future competitiveness.

The company therefore wants dialogue with selected suppliers and professional environments that may be relevant as strategic digitalization partners in the period ahead.

Digitalization, data, technology, and new ways of working will become increasingly important for productivity, project delivery, decision quality, and competitiveness in the construction and infrastructure industry. For the company, this is not only about technology. It is about strengthening the ability to execute projects better, make better decisions, and realize value in practice.

The purpose of this request is to identify digitalization partners with relevant experience, capacity, methodology, and implementation ability to support the company with digital transformation.

What The Company Is Looking For

The company is looking for suppliers who combine strategic advisory, strong technology understanding, and documented implementation ability.

The company is especially interested in environments that can see digitalization in connection with business, organization, work processes, data, technology, competence, and change management.

Relevant suppliers should be able to show experience from construction and infrastructure, or from other project-intensive businesses with similar complexity.

A future partner must understand where the industry stands today, which digital opportunities are realistic and value-creating in the short and long term, and how these can be turned into clear priorities and measurable effects.

The company is looking for a partner who can challenge, structure, and support the transition from ambition to concrete value.

Suppliers who can only deliver parts of the request are also relevant, but they should describe their specific contribution and how it can be included in a broader delivery together with a larger supplier or other partners.

About The Process

The company is carrying out this process as a Request for Digital Transformation. This means an open market and supplier dialogue where the company wants to explore possible partners, relevant approaches, and concrete contributions to its digital development.

The process sits between a traditional request for information and a request for proposal. It is intended to give the company a better decision basis for further dialogue with a limited selection of suppliers.

Relevant Contribution Areas

The company wants input from suppliers who can contribute within one or more of the following areas:

Digital strategy and transformation

This should connect business strategy, digital ambitions, and technology choices to clear business value.

Portfolio management, prioritization, and benefit realization

This should ensure that digital initiatives are prioritized, managed, and followed up from idea to realized effect.

Organization, work processes, and change capacity

This should strengthen digital maturity in the company and ensure that digital solutions are adopted with operational competence and capacity.

Technology architecture, data foundation, and artificial intelligence

This should strengthen the system landscape, data foundation, insight and analytics, automation, and decision support.

Project-near digitalization, collaboration, and specialized solutions

This should identify and scale concrete solutions for better project management, collaboration, and efficiency.

What Suppliers Are Asked To Describe

Suppliers are asked to describe how they can contribute to the company's further digital development, with special emphasis on:

Documented industry understanding from construction, especially infrastructure or other project-intensive businesses. This includes experience with complex projects, production-near processes, and collaboration across the value chain.

Relevant reference experience from comparable transformation and development work, with concrete examples of role, delivery model, results, and lessons learned.

Proposed approach and collaboration model for how the supplier would organize the work, involve the company's key resources, and ensure good progress, anchoring, and decision quality.

Team, capacity, and continuity, with a description of relevant key people, competence profile, availability, and ability to provide stable and motivated resources over time.

Ability to deliver in practice, with emphasis on how recommendations are turned into concrete deliverables, implementation, follow-up, and lasting effects in the company.

The company wants to use this dialogue to identify environments that can do more than provide advice. The company is looking for contributors who can help create real change, stronger execution ability, and clear business results.

The company invites relevant suppliers to submit a short and structured response to this request. Suppliers are encouraged to be sharp, practical, and creative in how they describe their contribution.

This is an opportunity to contribute to the next phase of digital development in a leading contractor business, with direct relevance to how technology, data, and new ways of working can create value.
